COVID-19 FAQ

What is contact tracing?

Contact tracing is used by health departments to prevent the spread of infectious disease. In general, contact tracing involves identifying people who have an infectious disease (cases) and their contacts (people who may have been exposed) and working with them to interrupt disease transmission. For COVID-19, this includes asking cases to isolate and contacts to quarantine at home.

What happens during contact tracing?

Generally, contact tracing includes the following steps:

- **Case investigation:** Public health staff work with a patient to help them recall everyone with whom they have had close contact during the time when they may have been infectious.
- **Contact tracing:** Public health staff begin contact tracing by notifying exposed individuals (contacts) of their potential exposure as rapidly and sensitively as possible, not revealing the infected patient’s identity.
- **Contact support:** Contacts are provided with education, information, and support to help them understand their risk, what they should do to separate themselves from others who are not exposed, and how to monitor themselves for illness. In addition, they are informed of the possibility that they could spread the infection to others even if they do not feel ill.
- **Self-quarantine:** Contacts are asked to stay home, monitor their health, and maintain social distance (at least 6 feet) from others until 14 days after their last exposure to the infected patient, in case they also become ill.

Resilient Wisconsin

If you have a preexisting mental or behavioral health condition, like depression or harmful substance use, the stress and anxiety of COVID-19—and the disruptions to routine care you may experience—can make taking care of yourself more difficult. Make sure to arrange for alternative care that maintains your treatment plan and medications, be aware of new or worsening symptoms, and work with your provider to find healthy coping strategies that work for you.
