COVID-19 FAQ

What is the news about COVID-19 being airborne?

In [guidance](#), released Thursday (July 9), WHO said that airborne transmission of COVID-19 in crowded, indoor locations with poor ventilation "cannot be ruled out." In addition to continuing current practices to limit the spread of COVID-19 (e.g., physical distancing, wearing cloth face coverings, handwashing, covering coughs and sneezes, and avoiding touching the eyes, nose, and mouth), a group of experts is urging that further measures be taken to reduce risk in enclosed spaces. These strategies are designed to limit the possibility of inhaling the virus and becoming infected while indoors:

- Provide sufficient and effective ventilation (e.g., increase the supply of clean outdoor air, minimize the recirculation of air) especially in public buildings, workplace environments, schools, hospitals, and long-term care facilities.
- Add to general ventilation with airborne infection controls such as local exhaust, high efficiency air filtration, and germicidal ultraviolet lights.
- Avoid indoor overcrowding, including on public transportation.

Resilient Wisconsin

Hope in Action: An Environmental Scan of Trauma-Informed Efforts to Prevent and Address Substance Harm in Wisconsin reviewed more than 70 community programs working at the intersections of trauma and substance harm. By identifying what's working well, what to avoid, and opportunities to maximize impacts, this report is a helpful tool for organizations seeking best practices, tools, and techniques for addressing the root causes of harmful substance use.
